What this is. These sheets turn your coaching philosophy into the rules the One Score app runs. Every athlete checks in each morning. The app scores them and builds their training for the day using your rules, not ours.

How every sheet works

1	Your philosophy	Free writing. Why you coach the way you do. Not imported.
2	Your decisions	Coaching questions with dropdown answers. Each answer quietly sets the app's numbers. Required.
3	Your program	Your exercises, drills, and days. Required where marked *.
4	Advanced numbers	Optional. Exact numbers that override a Layer 2 answer. Usually done with STS.

The rules for filling them out

Fill them on a computer or tablet in Adobe Acrobat, Preview, or a web browser, then save. Handwritten sheets cannot be imported.

Boxes marked * are required. The app will not import a sheet with a required box empty, and it will tell you which one.

Fill sheets 01 to 16 once for your facility. Fill sheet 17, Athlete Intake, once for every athlete.

Work in order. Later sheets use names from earlier ones: the sports on Sport Skill, the lift days on Strength, the tags on Core 4.

Words you will see

Zone	Green, Yellow, or Red. What the score means for today's training.
Check-in	Five taps each morning: sleep hours, sleep quality, soreness, stress, energy. Plus one tap for nutrition.
Trend	How the last 7 days of check-ins count alongside today.
RPE	How hard a session felt, 1 to 10. The athlete taps it after training.
Tonnage	Sets x reps x load for every lift in the session.
Training load	How much work the athlete did. Tonnage, minutes, and RPE combined.
A:C	This week's training load compared to the last month's. A big jump means the athlete is doing much more than they are used to.
Build day	A green day where the athlete has been under-loaded, so the app adds a set.
Anchor lift	The one main lift that stays fixed on a lift day for the whole block.
Day A, B, C	Your lift days in week order. The first lift day of the week is Day A.
Training max	The number all anchor loads are figured from. Set on test day.
Tag	A label on an exercise (Lower, Upper, Jump, Contact) so an injury restriction removes the right work.
Build, Blend, Express	Learn it clean, add variability, then do it at game speed.
